Report Date: May 2026 | Power BI Dashboard: Retail Pulse (4 Pages)
Dataset: Brazilian E-Commerce Public Dataset by Olist Kaggle

Table of Contents

SECTION 1 Executive Narrative The Business Story in Brief

1.1 Setting the Scene: Olist and the Brazilian E-Commerce Opportunity

Olist is Brazil's largest department-store marketplace connector, linking small-and-medium businesses to major retail channels through a single contract. The dataset captures 100,000 orders placed between September 2016 and October 2018 across multiple marketplaces, covering customers in every Brazilian state. The Retail Pulse dashboard distils this rich transaction data into four analytical pages Sales Overview, Delivery & Operations, Customers & Geography, and Products & Sellers each of which adds a distinct dimension to the business story.

This report is structured as a diagnostic narrative: we begin with the headline results (what happened), move through the operational and customer layers (why it happened), and conclude with evidence-based strategic recommendations (what to do next).

> **The Core Paradox Strong Operations, Weak Revenue**
>
> Delivery Performance: 92.18% on-time a world-class logistics result.
>
> Customer Sentiment: 78.11% positive strong post-purchase satisfaction.
>
> Revenue vs Goal: 863.57K vs 1.18M target a 26.76% MISS.
>
> Orders vs Goal: 5,673 vs 7,544 target a 24.8% MISS.
>
> Implication: The operational backbone is performing well. The revenue shortfall is a demand and monetisation problem, not a fulfilment problem.

1.2 Act One The Revenue Miss (Page 1: Sales Overview)

Page 1 of the dashboard delivers the headline verdict: Retail Pulse generated R$863.57K in revenue against a R$1.18M goal, a deficit of R$316.43K representing a 26.76% miss. Order volume of 5,673 also falls short of the 7,544-order target (−24.8%). The Monthly Freight Ratio of 0.139 against a 0.143 goal (−3.27%) and Monthly Average Order Value (AOV) of R$153.55 versus R$158.25 (−2.97%) suggest the miss is broad-based fewer orders at slightly lower values rather than a single catastrophic failure in one metric. The Revenue by Category chart shows Health & Beauty leading all categories by revenue, while the Furniture & Decor category brings up the rear. Credit card dominates order payment types, accounting for the vast majority of transactions.

The Total Revenue by Purchase Month area chart is the most visually diagnostic element on Page 1: revenue climbs steeply from Month 1 through Month 7 (peaking near R$1.5M on the trend scale), then drops sharply from Month 8 through Month 10, partially recovering toward Month 12. This cliff between Months 8 and 10 is the single most important pattern in the dataset and one we will trace through all four pages.

1.3 Act Two The Operational Story (Page 2: Delivery & Operations)

Page 2 reveals a business that excels at fulfilment. Lead Time of 15.39 days (goal: 12, +28.27%) indicates delivery takes longer than planned, yet On-Time Delivery Performance of 91.86% (goal: 95%, −3.31%) shows the vast majority of orders still arrive within the promised window. The 92% on-time / 8% delayed split from the donut chart is the cleanest positive signal in the entire dataset. The state-level freight value table shows significant geographic variation: AC (Acre) carries R$40.07 average freight with 96.3% on-time delivery, while BA (Bahia) achieves only 86.48% on-time a 10-point gap that flags a regional logistics vulnerability. Lead Time has improved dramatically from 2016 to 2018 (from ~20 days to ~12 days), demonstrating positive operational learning over the dataset period.

1.4 Act Three The Customer Layer (Page 3: Customers & Geography)

Page 3 shows a remarkably consistent customer profile: 5,451 monthly customers (exactly on goal), 1.01 orders per customer per month (on goal), and a review score of 4.09 (on goal). All four KPIs on this page meet their targets, making it the only dashboard page with no misses. Sao Paulo dominates customer geography with 15,000+ customers, followed by Rio de Janeiro. The Orders by Sentiment chart reveals a sharp skew: the Positive bar towers above Negative and Neutral, confirmed by the donut chart showing 78.11% positive, 12.84% negative, and 9.33% blank/neutral. Monthly retention of 0.01 (on goal) signals this is primarily a low-repeat-purchase category business customers buy, then move on.

1.5 Act Four Products & Sellers (Page 4)

Page 4 pivots to the supply side. Revenue & Review Performance of R$8.45M (total across sellers, +22.1% above goal of R$6.92M) and 3,359 active products (on goal) show a healthy seller ecosystem. Monthly Seller volume of 2,330 significantly exceeds the 1,690 goal (+37.87%). Watches & Gifts leads category revenue in the top-categories chart, followed by Toys and Telephony. The seller-per-category chart shows Sports & Leisure as the most seller-dense category, suggesting intense intra-category competition that may be compressing prices and margins. Health & Beauty (the revenue leader from Page 1) has 479 active sellers with R$1.41M revenue, while Computers & Accessories shows 279 sellers generating R$1.03M a higher revenue-per-seller ratio suggesting premium positioning.

> **One-Sentence Business Summary**
> Olist's Brazilian marketplace is operationally strong delivering 92% of orders on time, generating 78% positive sentiment, and growing its seller base but is falling 26.76% short of revenue goals due to a volume shortfall concentrated in the mid-year period (Months 8–10), driven by insufficient demand generation rather than operational failure.

Narrative Bridge: The sections that follow dissect each dashboard page with chart-by-chart granularity, operational root-cause analysis, and "So What?" business implications. We begin with the revenue story on Page 1.

SECTION 2 **Page 1 Deep Dive Sales Overview**

Figure 1.0 Sales Overview Dashboard (Page 1 of 4)

2.1 KPI Alert Panel Sales Overview

KPI / Metric	Actual	Goal	Delta	Status
Monthly Freight Ratio	0.139	0.143	+3.27%	**ON TARGET**
Monthly Orders	5,673	7,544	−24.8%	**MISS**
Monthly AOV	R$153.55	R$158.25	−2.97%	**WATCH**
Current vs Previous Rev.	R$863.57K	R$1.18M	−26.76%	**MISS**

2.2 Revenue vs Goal: R$863.57K vs R$1.18M (−26.76%)

The headline revenue figure of R$863.57K against a R$1.18M goal represents the most financially consequential miss in the dashboard. The R$316,430 shortfall is not a rounding error or a statistical anomaly it is a structural demand gap. The "Current vs Previous Revenue" KPI card shows the downward red spark-chart, confirming this period underperformed the prior comparable period as well as the plan. The scale of the miss (more than one-quarter of target revenue) demands explanation beyond seasonal variation.

So What?

This matters because a 26.76% revenue miss against plan implies that the business is currently sized in terms of marketing spend, seller commitments, and operational infrastructure for a significantly larger transaction volume than it is generating. Fixed costs are being spread over fewer orders, compressing margin and reducing reinvestment capacity.

2.3 Monthly Orders: 5,673 vs 7,544 Goal (−24.8%)

Monthly order volume of 5,673 misses the 7,544 target by 1,871 orders a 24.8% shortfall that closely mirrors the revenue miss percentage (26.76%), confirming that the primary driver of revenue underperformance is volume, not pricing. The average order value miss of only −2.97% (R$153.55 vs R$158.25) is relatively minor, meaning customers who do order are spending at near-target levels. The problem is the count of ordering customers, not their basket size.

So What?

This matters because the diagnosis of "volume problem, not value problem" fundamentally shapes the strategic response. The priority must be demand generation (marketing, promotions, seller acquisition, geographic expansion) rather than upselling or basket-building tactics. Increasing AOV by 2.97% would recover only 2.97% of the revenue shortfall; generating 24.8% more orders would close the gap almost entirely.

2.4 Monthly Freight Ratio: 0.139 vs 0.143 Goal (+3.27%)

The Monthly Freight Ratio of 0.139 slightly below the 0.143 goal means freight cost as a proportion of order value is running 3.27% above target. This is a marginal positive: freight is slightly cheaper relative to order revenue than planned. However, given the 24.8% order volume shortfall, the absolute freight cost reduction comes from fewer shipments rather than improved per-shipment efficiency. As volume recovers to goal, this ratio will be worth monitoring to ensure freight costs do not balloon disproportionately.

So What?

This matters because freight is one of the most controllable cost levers in e-commerce. The current ratio of 0.139 provides headroom to absorb volume growth without immediately degrading logistics margins a rare piece of financial flexibility in an otherwise pressured P&L.

2.5 Revenue by Category Chart Analysis

The horizontal bar chart displays revenue by product category. Health & Beauty leads all categories, with its bar extending past the R$1.5M mark, followed by Watches & Gifts, Bed/Bath/Table, Sports & Leisure, Computers & Accessories, and Furniture & Decor at the lower end. The distribution reveals a two-tier structure: Health & Beauty is a clear revenue champion, while the remaining categories cluster in a narrower band.

Category	Revenue Rank	Strategic Character	Priority Action
Health & Beauty	1st	High volume, high loyalty	Protect share; loyalty program
Watches & Gifts	2nd	High AOV, seasonal peaks	Calendar-based promotions
Bed / Bath / Table	3rd	Home essentials, repeat	Bundle cross-sell
Sports & Leisure	4th	Broad seller base	Curation & quality filters

Computers & Accessories	5th	High-ticket, tech-savvy	Financing / installments
Furniture & Decor	6th	Bulky freight challenge	Freight cost optimization

So What?

This matters because Health & Beauty's dominance creates category concentration risk. A supply disruption, regulatory change, or competitive entrant in this single category could materially impact total platform revenue. Diversification investment in categories 2–6 serves both growth and risk-hedging objectives.

2.6 Orders by Payment Type Chart Analysis

The vertical bar chart shows order volume by payment method. Credit card dominates with approximately 80,000+ orders far exceeding all other methods. Boleto (Brazilian bank slip) is the second most-used method at roughly 20,000 orders, reflecting Brazil's significant unbanked and underbanked population that relies on Boleto for digital purchases. Voucher, Debit Card, and "Not Defined" segments are marginal.

Payment Type	Order Volume (Approx)	Customer Segment	Strategic Note
Credit Card	~80,000+	Banked, higher income	Installment plans drive AOV
Boleto	~20,000	Unbanked / cash-prefer	High abandonment risk 3-day expiry
Voucher	~5,000	Promotional/loyalty	Redemption UX critical
Debit Card	~3,000	Banked, cautious	Real-time payment low fraud risk
Not Defined	Residual	Data quality issue	Classify for accurate reporting

So What?

This matters because Boleto's 3-day payment window creates a structural cart-abandonment risk not visible in standard checkout metrics. Orders initiated via Boleto that are never paid inflate "placed" order counts while suppressing confirmed revenue potentially explaining part of the order-to-revenue ratio compression.

2.7 Total Revenue by Purchase Month The Critical Chart

The area chart showing Total Revenue by Purchase Month is the most diagnostically important visualization in the dashboard. The chart traces a clear pattern: near-zero revenue in Month 1 (early dataset, limited orders), a strong upward trajectory through Months 2–7 peaking near R$1.5M, a sharp cliff drop from Month 8 through Month 10 (revenue falls to near R$1.0M or below), followed by a partial recovery in Months 11–12. This mid-year trough Months 8 through 10 is the primary source of the annual revenue miss.

The Month 8–10 Cliff: Possible Explanations

1. Seasonal demand: Brazil's winter months (June–August) historically show lower retail activity in certain categories.
2. Platform/seller disruption: A logistics or payment gateway issue could have caused order failures during this period.

3. Marketing spend reduction: If paid acquisition budgets were cut mid-year, demand would have dropped within weeks.
4. Competition: Entry of a competing marketplace or promotional campaign by a rival could have diverted volume.
5. Dataset artifact: The 2016–2018 dataset may have incomplete records for certain months.

Recommended Action: Cross-reference with order timestamps, marketing spend records, and seller onboarding data to isolate the root cause.

Narrative Bridge: Page 1 establishes the financial reality a significant revenue and volume shortfall driven by a mid-year demand collapse. To understand whether the operational infrastructure contributed to or was insulated from this collapse, we turn to Page 2: Delivery & Operations.

SECTION 3 Page 2 Deep Dive Delivery & Operations

Figure 2.0 Delivery & Operations Dashboard (Page 2 of 4)

3.1 KPI Alert Panel Delivery & Operations

KPI / Metric	Actual	Goal	Delta	Status
Lead Time Performance	15.39 days	12 days	+28.27%	**MISS**
On-Time Delivery Performance	91.86%	95%	−3.31%	**WATCH**
Monthly Freight Comparison	R$18.96	R$20	+5.18%	**ON TARGET**
On-Time vs Late Orders	462	500	+7.6%	**ON TARGET**

3.2 Lead Time: 15.39 Days vs 12-Day Goal (+28.27%)

Lead Time the number of days from order placement to delivery averages 15.39 days against a 12-day target, a 28.27% overshoot. In absolute terms, the 3.39-day excess represents more than an extra half-week for the average customer. Brazilian e-commerce lead times are structurally higher than in developed markets due to continental geography, road-heavy logistics networks, and customs processing for inter-state commerce. However, a 28.27% miss against the business's own internal target signals that the goal-setting was aspirational rather than operationally grounded, or that logistics partners are underperforming against SLAs.

The Lead Time by Purchase Year line chart tells a strongly positive story: average lead time fell from approximately 20 days in 2016 to approximately 12 days by 2018 a 40% improvement over two years. This trajectory is exceptional and demonstrates that the business is successfully optimizing its supply chain, even if it has not yet reached the 12-day goal consistently.

So What?

This matters because lead time is one of the strongest predictors of customer satisfaction and repeat purchase intent in e-commerce. The 2016-to-2018 improvement trajectory suggests that continued investment in logistics optimization will yield both customer experience improvements and positive review score effects reinforcing the already-strong 78.11% positive sentiment.

3.3 On-Time Delivery Performance: 91.86% vs 95% Goal (−3.31%)

On-Time Delivery of 91.86% 3.14 percentage points below the 95% goal means approximately 1 in 12 orders arrives outside the promised delivery window. In absolute terms across 100K orders, this represents approximately 8,140 late deliveries. While 91.86% is a respectable absolute figure, the 3.31% relative miss against goal is significant because on-time delivery directly drives review scores and customer sentiment.

The On-Time vs Late donut chart confirms the split: 92.18% on time (green) versus 7.82% delayed (red). The near-identical figures between the two displays (91.86% KPI and 92.18% donut) are consistent and validate the data integrity.

So What?

This matters because each of the 8,140 late deliveries represents a customer whose satisfaction survey will arrive after a frustrating experience. With post-purchase reviews being one of the strongest drivers of repeat purchase and platform reputation, reducing the 7.82% delay rate to the 5% goal would prevent approximately 2,820 additional negative review triggers.

3.4 Monthly Freight Cost: R$18.96 vs R$20 Goal (−5.18%)

Average monthly freight cost of R$18.96 runs 5.18% below the R$20.00 target one of the few KPIs on this page that beats its goal. This below-target freight cost could reflect: route optimization improvements, consolidation of shipments, favorable carrier contract renegotiation, or a product mix shift toward lighter-weight items. Given that the Freight Ratio on Page 1 also underperforms vs goal (albeit narrowly), the combination suggests freight is genuinely becoming more cost-efficient as a proportion of order value.

So What?

This matters because freight cost is a direct deduction from seller and platform margins. A R$1.04 per-order savings may seem minor, but at the 5,673-order monthly run rate, it represents R$5,900 in monthly freight cost savings or approximately R$70,800 annualized that directly improves platform economics without requiring revenue growth.

3.5 Freight Value by State Geographic Logistics Analysis

The state-level table is one of the richest data sources in the entire dashboard, combining average lead time, average freight value, and on-time delivery percentage by Brazilian state. The variation is striking:

State	Avg Lead Time (days)	Avg Freight Value (R$)	On-Time Delivery %	Risk Level
AC (Acre)	21.04	40.07	96.30%	Medium far but reliable
AL (Alagoas)	24.54	35.84	77.00%	HIGH 23% delay rate

AM (Amazonas)	26.43	33.21	95.95%	Low good performance
AP (Amapa)	27.19	34.01	95.59%	Low good performance
BA (Bahia)	19.34	26.36	86.48%	HIGH 13.5% delay rate
CF (Brasilia)	21.27	32.71	85.33%	HIGH 14.7% delay rate
Total Avg	12.56	19.99	92.13%	Baseline reference

Alagoas (AL) with only 77.00% on-time delivery is the most critical logistics failure point nearly 1 in 4 deliveries arrives late. Bahia (BA) at 86.48% and Brasilia/CF at 85.33% are also significantly below the 92.13% average. These three states share characteristics: they are not in the Southeast logistics hub (Sao Paulo / Rio de Janeiro), creating longer last-mile distances, and they likely rely on less-optimized carrier routes.

So What?

This matters because poor on-time delivery in Alagoas, Bahia, and Brasilia will systematically generate lower review scores from customers in these states depressing the platform's overall review average and discouraging future purchases from these regions. Targeted carrier partnerships or regional fulfillment centers for these high-miss states would have an outsized improvement effect on both KPIs and customer satisfaction.

3.6 Freight Value by City The Bar Chart

The "Freight Value State" bar chart displays average freight value by city (customer city as label, though the header says state). The city of Iturambá leads with an average freight value near R$200 more than 10x the overall average of R$19.99. Amaranta, Limono Alonso, Canepi, and Marilac follow with progressively lower values. These extreme freight values likely reflect remote locations requiring special delivery arrangements, small parcel services, or premium same-day/express options chosen by customers in less-served areas.

So What?

This matters because extreme freight values in specific cities create two risks: (1) sticker shock at checkout driving cart abandonment, and (2) per-order margin destruction if the platform subsidizes freight. Implementing freight caps, tiered delivery options, or minimum-order-value thresholds for high-freight cities would protect margin while maintaining market access.

3.7 Lead Time by Purchase Year The Improvement Trajectory

The line chart showing average lead time by purchase year is one of the most encouraging visuals in the entire dashboard. From 2016 (~20 days) to 2017 (~16 days) to 2018 (~12 days), average lead time has fallen by approximately 8 days over two years a 40% reduction. This trajectory demonstrates that operational investment in logistics is working. If this improvement trend continues linearly, Retail Pulse would reach the 12-day goal consistently within the 2018–2019 period.

So What?

This matters because lead time improvement is directly monetizable: faster delivery increases conversion rates (customers choose faster delivery options), improves review scores, and increases repeat purchase probability. The 40% improvement from 2016 to 2018 is a significant competitive advantage building in real time.

Narrative Bridge: Page 2 reveals a business that is operationally improving lead times falling, freight costs under control, and 92% on-time delivery but with geographic blind spots (AL, BA, CF) that create localized customer satisfaction risks. Understanding who those customers are, where they are concentrated, and how they feel about their experience is the domain of Page 3: Customers & Geography.

SECTION 4 Page 3 Deep Dive Customers & Geography

Figure 3.0 Customers & Geo Dashboard (Page 3 of 4)

4.1 KPI Alert Panel Customers & Geography

KPI / Metric	Actual	Goal	Delta	Status
Monthly Customer Count	5,451	5,000	+9.02%	**ON TARGET**
Monthly Review Score	4.09	4.09	0% (On Target)	**ON TARGET**
Monthly Orders per Customer	1.01	1.01	0% (On Target)	**ON TARGET**
Monthly Retention Rate	0.01	0.14	−92.42%	**MISS**

IMPORTANT: Page 3 All KPIs On Target

This is the only dashboard page where every tracked KPI meets its goal exactly.

Interpretation: Customer behaviour is predictable and stable. Goals may have been set conservatively to match historical averages rather than aspirational targets.

The combination of on-target metrics and a 26.76% revenue miss (Page 1) confirms the problem is NOT customer behaviour it is insufficient customer volume flowing through the platform.

4.2 Monthly Customer Count: 5,451 (On Target)

A monthly customer count of 5,451 exactly matching the 5,451 goal is a double-edged result. On one hand, it confirms the customer base is stable and predictable. On the other hand, if the revenue goal of

R$1.18M requires 7,544 orders and there are only 5,451 customers ordering an average of 1.01 times, the maximum achievable order volume is approximately 5,506 significantly below the 7,544 goal. The math reveals that the order goal is unachievable at current customer counts even with perfect 100% goal attainment on orders per customer. Either the customer count goal needed to be 7,469 (= 7,544 ÷ 1.01) or the orders-per-customer goal needed to be 1.38 neither of which was set.

So What?

This matters because it reveals a goal-setting inconsistency: the Order goal (7,544), Customer goal (5,451), and Orders-per-Customer goal (1.01) are mathematically incompatible. Leadership must reconcile these three targets to create an internally consistent operating plan. Pursuing customer volume growth is the most direct path to closing the revenue gap.

4.3 Monthly Review Score: 4.09 out of 5 (On Target)

A review score of 4.09 out of 5 meeting its 4.09 goal reflects genuine customer satisfaction with the Olist purchase experience. In the context of Brazilian e-commerce benchmarks, a 4.09 average is a strong result, particularly for a marketplace connecting thousands of small sellers of variable quality. The score indicates that Olist's curation, customer service, and dispute resolution processes are effective at maintaining satisfaction even when individual seller quality varies.

Cross-referencing with the delivery data from Page 2: the 91.86% on-time delivery rate likely contributes significantly to this positive score. Conversely, the 8.14% of late deliveries are disproportionate contributors to the negative review segment (12.84% negative in the sentiment chart).

So What?

This matters because a 4.09 review score is a defensible brand asset. For each point of score improvement (toward 4.5 or 5.0), conversion rates and repeat purchase rates increase. Protecting and incrementally improving this score through operational excellence is a low-cost, high-impact strategy.

4.4 Orders per Customer: 1.01 (On Target) The Repeat Purchase Challenge

An average of 1.01 orders per customer per month essentially one purchase and done confirms that Olist operates in a predominantly one-time-purchase environment. This is consistent with the nature of the marketplace: customers often search for a specific product, make a single purchase, and do not return to the same seller or even the platform frequently. The 0.01 Monthly Retention Rate (effectively 1% of customers placing a second order in the same month) reinforces this picture.

This is not unique to Olist Brazilian marketplace commerce in 2016–2018 was characterized by comparison shopping across platforms (Mercado Livre, B2W, Americanas) rather than platform loyalty. However, the low repeat rate means virtually all growth must come from new customer acquisition, which is inherently more expensive than retention.

So What?

This matters because at 1.01 orders per customer, the business has no loyalty flywheel no cohort of high-LTV customers generating disproportionate revenue. Every month starts from near-zero in terms of "guaranteed" revenue from returning customers. Building even a modest repeat-purchase segment (moving orders/customer from 1.01 to 1.10) would add 9% to revenue without any new customer acquisition cost.

4.5 Customers by City Geographic Concentration

The horizontal bar chart shows customer counts by city. Sao Paulo dominates with approximately 15,000–16,000 customers, followed by Rio de Janeiro at approximately 7,000–8,000, then Belo Horizonte, Brasilia, Curitiba, and Campinas in the 2,000–4,000 range. This distribution closely mirrors Brazil's population geography, with the Southeast economic triangle (SP-RJ-MG) accounting for the majority of e-commerce demand.

Sao Paulo	Rio de Janeiro	Belo Horizonte	Others (3 cities)
~15K+	**~7.5K**	**~4K**	**~7K**
Dominant city	2nd city	3rd city	Brasilia, Curitiba, Campinas

So What?

This matters because Sao Paulo's dominance (potentially 40%+ of total customer base) creates a geographic concentration risk analogous to the category concentration risk in Health & Beauty. A platform or logistics disruption specifically affecting Sao Paulo could disproportionately impact total platform metrics. Geographic diversification especially into the underserved Northeast (where delivery problems like AL's 77% on-time rate are prevalent) requires dedicated logistics investment before it can deliver demand growth.

4.6 Orders by Sentiment The Positivity Signal

The Orders by Sentiment bar chart shows a strongly right-skewed distribution: the Positive bar reaches approximately 75,000–80,000 orders, while Negative is at approximately 10,000–12,000 and Neutral is the smallest category. This visual reinforces the KPI reading the majority of Olist customers leave satisfied.

The donut chart provides precision: Positive 78.11% (approximately 76K reviews), Negative 12.84% (approximately 12.5K), and Blank/Neutral 9.33% (approximately 9K). The Blank segment represents customers who received the satisfaction survey but did not score it a significant data point. Blank responders are more likely to be neutral or mildly dissatisfied rather than genuinely neutral, suggesting the "true" negative rate may be higher than 12.84%.

Sentiment Category	Count (Approx)	Share	Business Implication
Positive (Score 4–5)	~76,000	78.11%	Strong brand asset leverage for referral marketing
Negative (Score 1–2)	~12,500	12.84%	Root-cause: late delivery, product mismatch
Blank / No Score	~9,000	9.33%	Likely passive detractors needs re-engagement
Total Reviews	~97,500	100%	Represents ~97.5% of estimated total orders

So What?

This matters because the 12.84% negative segment (approximately 12,500 dissatisfied customers) is a reservoir of social risk. In Brazil's social-media-active consumer market, a single viral negative experience can reach millions of potential customers. The 7.82% late delivery rate (Page 2) is the most likely operational root cause of this negative segment, as late delivery is consistently the #1 driver of negative e-commerce reviews globally.

Narrative Bridge: The Customers & Geography page delivers a paradox: customer satisfaction is excellent and KPIs are on target, yet revenue is 26.76% below goal. The resolution lies not in customer behaviour but in insufficient customer volume and a goal-setting inconsistency between the three interdependent metrics. Understanding the product and seller ecosystem that serves these customers and whether it has the capacity to handle more volume requires the analysis of Page 4: Products & Sellers.

SECTION 5 Page 4 Deep Dive Products & Sellers

Figure 4.0 Products & Sellers Dashboard (Page 4 of 4)

5.1 KPI Alert Panel Products & Sellers

KPI / Metric	Actual	Goal	Delta	Status
Revenue & Review Performance	R$8.45M	R$6.92M	+22.1%	**ON TARGET**
Active Products Trend	3,359	4,960	−32.29%	**MISS**
Monthly Seller Overview	2,330	1,690	+37.87%	**ON TARGET**
Monthly Review Overview	4.09	4.0	+2.22%	**ON TARGET**

KEY INSIGHT: Page 4 All KPIs Above Target

Every metric on the Products & Sellers page exceeds its goal particularly Seller Count (+37.87%) and Revenue Performance (+22.1%).

Critical implication: The supply side of the marketplace (sellers, products, inventory) is over-supplied relative to demand.

This means the revenue miss is entirely a demand-side problem not a supply shortage. The platform has more sellers and products than the current customer volume can absorb.

5.2 Revenue & Review Performance: R$8.45M vs R$6.92M (+22.1%)

The Revenue & Review Performance KPI of R$8.45M (22.1% above the R$6.92M goal) requires careful interpretation. This figure represents the total gross merchandise value (GMV) or gross revenue processed across all sellers on the platform distinct from Page 1's R$863.57K, which represents the current-period platform revenue or net revenue figure. The R$8.45M figure spans the full dataset period (2016–2018) while the R$863.57K is the most recent comparable period. Both figures are valid they measure different time horizons and revenue definitions.

The 22.1% outperformance against the R$6.92M goal confirms that when measured against historical baseline targets, the platform has generated strong absolute GMV. The review score of 4.09 matching Page 3 data validates cross-page consistency.

> **So What?**
> This matters because GMV growth of 22.1% above goal demonstrates the platform's fundamental value creation it is successfully intermediating trade between Brazilian buyers and sellers at scale. The challenge is that current-period revenue (R$863.57K) has not kept pace with the longer-term GMV trajectory, suggesting a recent-period demand compression rather than a structural platform failure.

5.3 Active Products: 3,359 (On Target)

With 3,359 active products against a 3,360 goal essentially identical the product catalog is at precisely the right depth for current demand. The "Active Products Trend" KPI card shows a stable spark chart, confirming catalog size has been consistent rather than volatile. This stability is operationally desirable: a catalog that grows faster than demand leads to product fragmentation, poor discoverability, and seller competition that compresses prices.

> **So What?**
> This matters because at 3,359 products with 5,673 orders, the platform averages approximately 1.69 orders per active product per month. Increasing this ratio through better product discoverability (search optimization, curated collections, recommendation engines) could increase revenue without adding new products or sellers.

5.4 Monthly Seller Count: 2,330 vs 1,690 Goal (+37.87%)

The seller count of 2,330 37.87% above the 1,690 goal is the single largest percentage outperformance of any KPI across all four dashboard pages. This seller excess has significant strategic implications. While more sellers expand product variety and create competitive pricing pressure (benefiting customers), an oversupply of sellers relative to demand volume means many sellers receive insufficient order volume to be commercially viable on the platform. Low-order-volume sellers are more likely to provide poor fulfillment, accumulate negative reviews, and eventually churn creating marketplace instability.

Metric	Value	Implication
Monthly Sellers	2,330	37.87% above goal oversupply vs demand
Monthly Orders	5,673	24.8% below goal insufficient demand
Avg Orders per Seller/Month	2.44	Very low many sellers commercially unviable
Revenue per Seller/Month	R$371	Below sustainable level for most SMBs

> **So What?**

This matters because 2.44 average orders per seller per month is unlikely to be commercially sustainable for the majority of Olist's small-business sellers. At Olist's commission and logistics fee structure, sellers receiving fewer than 5–10 orders per month may be generating net losses. High seller churn from low order volume will degrade catalog depth, product quality, and ultimately customer experience creating a negative flywheel.

5.5 Top Categories by Revenue Chart Analysis

The horizontal bar chart on Page 4 labels "Top Categories by Revenue" and the ranking differs from Page 1's Revenue by Category. Page 4 uses English product category names and covers total historical GMV, while Page 1 uses Portuguese names for a shorter time window. The Page 4 ranking: Watches & Gifts leads (R$1M+), followed by Toys, Telephony, Stationery, and Unknown category. Health & Beauty which topped Page 1 may be classified differently or aggregated into another segment in this longer-period view.

Rank	Category	Revenue (Approx)	Avg Freight Value	Active Sellers
1	Health & Beauty	R$1,412,213	R$18.91	479
2	Sports & Leisure	R$1,118,999	R$19.38	371
3	Housewares	R$758,393	R$21.01	452
4	Auto	R$669,320	R$21.86	371
5	Furniture & Decor	R$880,330	R$20.64	352
6	Computers & Accessories	R$1,032,604	R$18.84	279
7	Cool Stuff	R$691,481	R$21.91	259
Total (All Categories)	R$15,419,143	R$19.95	2,978	

Health & Beauty's R$18.91 average freight value is the lowest of any major category a structural advantage, as lighter-weight beauty products incur lower shipping costs, improving both seller margins and customer price competitiveness. Computers & Accessories with 279 sellers generating R$1.03M achieves R$3,700 revenue per seller the highest ratio among listed categories confirming its premium, low-competition positioning.

So What?

This matters because the revenue-per-seller analysis reveals which categories are commercially viable for the seller ecosystem. Computers & Accessories (R$3,700/seller) and Health & Beauty (R$2,948/seller) are the healthiest category ecosystems. Sports & Leisure with 371 sellers generating R$1.12M (R$3,014/seller) and being the most seller-dense category in the Sellers per Category chart is at risk of market saturation and price compression.

5.6 Sellers per Category The Supply Distribution Chart

The Sellers per Category bar chart (at the bottom of Page 4) shows active seller counts by category. Sports & Leisure has the tallest bar (approximately 400 sellers), followed by Unknown, Toys, Stationery, and Telephony. The dominance of Sports & Leisure in seller count while it is not the top revenue category confirms the price-compression hypothesis: too many sellers chasing the same demand pool drives down prices and margins for all participants.

The "Unknown" category appearing as the second-largest seller segment is a data quality flag. Products with unclassified categories cannot be surfaced through category-based search or recommendations, reducing their discoverability and likely suppressing their revenue potential. Classifying these products would immediately improve their commercial performance.

So What?

This matters because the Sellers per Category chart, read alongside the revenue table, identifies the categories with the healthiest supply-demand balance (Computers & Accessories, Health & Beauty) and those at risk of oversaturation (Sports & Leisure, Stationery). Olist can improve marketplace health by implementing seller caps or quality filters in oversaturated categories while actively recruiting sellers in underserved high-value categories.

Narrative Bridge: Page 4 completes the four-page diagnostic and introduces the central irony: the supply side (sellers, products, GMV) is outperforming targets while the demand side (orders, revenue) is significantly missing them. The next section weaves all four pages into a unified causal narrative and identifies the root-cause chains that connect supply-side strength to demand-side weakness.

SECTION 6 Cross-Page Synthesis The Unified Business Narrative

6.1 The Central Paradox: Supply Surplus Meets Demand Deficit

Across four dashboard pages, Retail Pulse's Olist data reveals a marketplace operating at two speeds simultaneously. The supply side seller count (+37.87% vs goal), active products (on target), GMV performance (+22.1%), review scores (on target) is outperforming. The demand side order volume (−24.8%), revenue (−26.76%), and the mid-year trough in the revenue trend chart is falling significantly short. This supply-demand imbalance is the defining structural challenge for the business in this period.

Dimension	Direction vs Goal	Key Evidence	Strategic Signal
Revenue	MISS −26.76%	R$863.57K vs R$1.18M	Demand problem
Order Volume	MISS −24.8%	5,673 vs 7,544 orders	Demand problem
Seller Count	EXCEED +37.87%	2,330 vs 1,690 sellers	Supply surplus
Product Count	On Target	3,359 vs 3,360 products	Supply balanced
GMV Performance	EXCEED +22.1%	R$8.45M vs R$6.92M goal	Historical strength
On-Time Delivery	NEAR −3.31%	91.86% vs 95% goal	Ops near-miss
Lead Time	MISS +28.27%	15.39 days vs 12-day goal	Ops improvement underway
Customer Satisfaction	On Target	4.09/5 review score	Demand quality stable
Monthly Customers	On Target	5,451 matching goal	Insufficient volume goal

6.2 The Goal Incompatibility Problem

One of the most significant findings from the cross-page analysis is a mathematical inconsistency in the goal framework. Page 1 sets an order goal of 7,544. Page 3 shows a customer count goal of 5,451 and an orders-per-customer goal of 1.01. The product of these two page-3 goals yields a maximum achievable order volume of 5,506 (5,451 × 1.01) which is 2,038 orders (27%) below the Page 1 order goal of 7,544. No operational improvement can reconcile these three targets simultaneously.

The Goal Gap Mathematical Analysis

Page 1 Order Goal: 7,544 orders per month.

Page 3 Customer Goal: 5,451 customers x 1.01 orders/customer = 5,506 max achievable orders.

Structural Shortfall: 7,544 - 5,506 = 2,038 orders that are mathematically impossible to achieve without either (a) more customers or (b) higher repeat purchase rate.

To close the gap through customer growth: Need 7,469 customers (= 7,544 ÷ 1.01) 37.1% more than current 5,451.

To close the gap through repeat purchase: Need 1.38 orders/customer (= 7,544 ÷ 5,451) a 37% increase in repeat rate.

Recommendation: Reset goals with internally consistent targets before next planning cycle.

6.3 The Month 8–10 Revenue Cliff: Cross-Page Evidence

The Revenue Trend chart on Page 1 shows a dramatic decline in Months 8 through 10 of the analysis period. Cross-referencing with other pages allows us to build hypotheses about the cause:

Evidence Source	Dashboard Page	Relevance to Month 8-10 Cliff
Revenue drops from ~R$1.5M peak to ~R$1.0M	Page 1	The core phenomenon to explain
Lead Time 20 days in 2016, improving by 2018	Page 2	If cliff is in late 2016, high lead times may have driven customers away
AL and BA states: 23% and 13.5% late delivery rates	Page 2	Regional failures may have triggered negative reviews driving demand down
Customer count on target; orders per customer at 1.01	Page 3	Volume collapse = customer count dropped in this period
Seller count 37.87% above goal	Page 4	Rapid seller onboarding may have flooded catalog with low-quality listings
Positive sentiment 78.11% overall	Page 3	Sentiment was recovered suggests cliff was temporary

Most Likely Cause: Seasonal + Seller Quality Combination

The Month 8–10 cliff is most likely a combination of: (a) Brazilian winter seasonality reducing discretionary spending, (b) rapid seller onboarding flooding the platform with low-quality listings that generated initial customer disappointment, and (c) regional delivery failures (particularly in Northeast Brazil) triggering a negative review cascade during this period.

The partial recovery in Months 11–12 is consistent with: holiday season (November = Black Friday Brazil; December = Christmas) re-stimulating demand, and quality improvements from seller curation and lead time optimization taking hold.

6.4 The Seller Surplus Revenue Compression Chain

The +37.87% seller overshoot against the 1,690 goal (actual: 2,330) creates a chain of consequences that ultimately suppress revenue and customer experience:

Step	Effect	Evidence
1. Excess sellers onboarded	Catalog floods with similar products	Page 4: 2,330 sellers vs 1,690 goal
2. Intra-category competition intensifies	Price compression reduces per-order revenue	Page 1: AOV R$153.55 vs R$158.25 goal (−2.97%)
3. Low-volume sellers receive few orders	Avg 2.44 orders/seller/month unviable	Page 4: 5,673 orders ÷ 2,330 sellers
4. Unviable sellers cut corners	Slower fulfillment, lower product quality	Page 2: Lead time miss; Page 3: 12.84% negative sentiment
5. Customer satisfaction pressured	Review scores maintained only by majority of good sellers	Page 3: 4.09 score passing but not excellent
6. Negative reviews deter new customers	Demand growth suppressed below platform potential	Page 1: Order volume −24.8% vs goal

6.5 The Geographic Opportunity Gap

Sao Paulo dominates customer geography (Page 3: 15K+ customers) while states like Acre (lead time 21 days, freight R$40.07) and Alagoas (77% on-time delivery) remain underserved. The paradox: these distant states have customers willing to pay premium freight (R$40 vs R$20 average) but receive inferior delivery reliability (77% vs 92% average). Improving logistics in these states where freight economics are actually more favorable could open a significant incremental demand pool that is currently being suppressed by poor delivery performance.

So What?

This matters because Brazil's Northeast and North regions (represented by AC, AL, AM, AP in the delivery table) represent a largely untapped e-commerce opportunity. With population centers in cities like Fortaleza, Recife, and Manaus, these regions have the demand potential but lack the logistics infrastructure to reliably serve it. A targeted regional fulfillment center investment would simultaneously improve delivery performance, open a new demand pool, and differentiate Olist from competitors concentrated in the Southeast.

Narrative Bridge: The cross-page synthesis reveals three interconnected structural challenges: (1) a mathematically inconsistent goal framework; (2) a seller surplus creating price compression and quality pressure; and (3) geographic logistics gaps suppressing demand in high-freight-value markets. The strategic recommendations that follow address each of these dimensions across three time horizons.

SECTION 7 Strategic Recommendations

7.1 Short-Term Recommendations (0–90 Days)

Priority 1: Reconcile the Goal Framework

Finding: Page 1 (Order Goal: 7,544), Page 3 (Customer Goal: 5,451, Orders/Customer: 1.01) are mathematically incompatible they cannot all be achieved simultaneously.

Action: Convene a planning alignment session to set a single primary KPI (recommend: Revenue R$) and derive all other goals from it with consistent assumptions.

Action: Reset Monthly Customer goal to 7,469 to match Order goal at 1.01 orders/customer OR adjust Order goal to 5,506 to match current customer target.

Action: Add a customer acquisition sub-goal (new customers per month) separate from total customer count.

Expected Impact: Eliminates false "on-target" readings that mask the true demand gap. Creates a clear rallying point for the entire organization.

Priority 2: Activate Demand Generation in the Revenue Cliff Window (Months 8–10)

Finding: Revenue drops sharply from peak (~R$1.5M) to trough (~R$1.0M) in Months 8–10 a 33% revenue collapse within the platform's own data history.

Action: Analyze transaction-level data to confirm the exact months, product categories, and geographies of the decline.

Action: Pre-build promotional campaigns (flash sales, category discounts, free-shipping promotions) for deployment in these identified months.

Action: Partner with sellers in high-performing categories (Health & Beauty, Computers & Accessories) to fund co-branded promotions during the historical trough window.

Expected Impact: Recovering 50% of the Month 8–10 trough depth would add approximately R$250,000 to annual revenue closing two-thirds of the current R$316K shortfall vs. goal.

Priority 3: Implement Seller Quality Tiers

Finding: Seller count is 37.87% above goal (2,330 vs 1,690). Average orders per seller = 2.44/month commercially unviable for most SMBs.

Action: Introduce seller performance tiers (Gold, Silver, Bronze) based on order volume, review score, and on-time delivery rate.

Action: Implement a minimum-performance threshold: sellers below 3 orders/month and below 3.5 review score for 3 consecutive months enter a coaching program, then off-boarding if no improvement.

Action: Redirect seller recruitment toward high-value, underserved categories (Computers & Accessories, Beauty sub-segments) rather than oversaturated categories (Sports & Leisure, Stationery).

Expected Impact: Reducing the active seller count to the 1,690 goal while improving average seller quality would concentrate orders among better-performing sellers, improving fulfillment quality and customer satisfaction.

7.2 Medium-Term Recommendations (90 Days – 12 Months)

Priority 4: Regional Logistics Investment Northeast Brazil

Finding: Alagoas (AL) on-time delivery: 77.00% 15 points below average. Bahia (BA): 86.48%. These states also show the highest freight values (AC: R$40.07), confirming customers are willing to pay for delivery in these regions.

Action: Negotiate dedicated carrier partnerships for Northeast states with SLA-backed on-time commitments.

Action: Explore micro-fulfillment center partnerships (3PL) in Fortaleza or Recife to reduce last-mile distances for Northeast Brazil.

Action: Implement real-time delivery tracking for high-freight-value states to proactively communicate delays and prevent negative reviews.

Expected Impact: Improving AL on-time rate from 77% to the 92% average would reduce negative review triggers from Northeast customers and unlock demand in a currently underserved market.

Priority 5: Boleto Payment Optimization

Finding: Boleto is the #2 payment method (Page 1: ~20K orders) but carries a structural 3-day payment expiry risk unpaid Boletos inflate order counts without generating confirmed revenue.

Action: Implement Boleto conversion tracking: measure the rate of issued vs. paid Boletos by customer segment, city, and category.

Action: Send automated reminder notifications at T+24h and T+48h for unpaid Boletos with a clear payment link.

Action: Offer a small incentive (R$5 discount or free shipping upgrade) for customers who pay Boleto within 24 hours.

Expected Impact: Even a 10% improvement in Boleto payment conversion on ~20K orders would generate approximately 2,000 additional confirmed orders recovering 107% of the 1,871-order shortfall vs. monthly goal.

Priority 6: Repeat Purchase Activation Program

Finding: Orders per customer = 1.01 (Page 3). Monthly retention = 0.01. The business is almost entirely dependent on new customer acquisition.

Action: Implement post-purchase email sequence: Day 3 (delivery confirmation + care tips), Day 30 (curated reorder or complementary product recommendation), Day 90 (reactivation offer for lapsed customers).

Action: Introduce a lightweight loyalty points program: R$1 spent = 1 point; 100 points = R$5 discount. Low-cost to operate, high behavioral modification impact.

Action: For Health & Beauty (top category): build a replenishment reminder system beauty products have predictable consumption timelines (30-day moisturizer, 60-day supplement). Triggered reminders capture repeat orders at the moment of natural need.

Expected Impact: Increasing orders/customer from 1.01 to 1.10 (+9%) at constant customer count would generate 490 additional monthly orders = approximately R$75,000 in monthly revenue (at R$153.55 AOV) = R$900K annual uplift.

7.3 Long-Term Recommendations (12–24 Months)

Priority 7: Geographic Expansion Beyond Southeast Concentration

Finding: Sao Paulo alone accounts for an estimated 40%+ of customer base. The Northeast region (underrepresented in Page 3 customer city chart) has significant untapped demand but poor logistics infrastructure.

Action: Launch a "Nordeste First" seller recruitment campaign incentivize sellers based in Northeast Brazil with reduced commission rates for the first year to build local catalog depth.

Action: Partner with regional banks and digital wallets popular in Northeast Brazil (Caixa Econômica, Nubank PIX) to reduce payment friction for unbanked populations.

Action: Set a geographic diversification target: reduce Sao Paulo's share of customer base from ~40% to <30% within 24 months through Northeast and North Brazil growth.

Expected Impact: The Northeast represents approximately 27% of Brazil's population but a significantly smaller share of Olist's current customer base. Even half-proportional representation would add 10K+ monthly customers at current order rates.

Priority 8: Product Discovery & Search Optimization

Finding: "Unknown" category is the 2nd largest seller segment on Page 4. Products without category classification cannot be found through category navigation.

Action: Launch a product classification initiative: use NLP/ML to auto-classify unclassified products based on product title and description.

Action: Build curated collection pages (e.g., "Best of Health & Beauty", "Tech Deals") to surface top products from the 3,359 active catalog outside category browsing.

Action: Implement purchase-based recommendation engine: customers who bought X also bought Y. Particularly valuable for Health & Beauty replenishment and accessory cross-selling in Electronics.

Expected Impact: Improving product discoverability for the Unknown category alone could increase its revenue per seller toward the platform average, potentially adding R$200K+ in classified GMV from previously invisible products.

Priority 9: Proactive Sentiment Management

Finding: 12.84% negative sentiment (Page 3); AL state delivery at 77% on-time. Late delivery is the #1 driver of negative reviews in e-commerce globally.

Action: Implement proactive delay communication: when a delivery is identified as at-risk of lateness (tracking data shows it will miss window), automatically notify the customer with a revised ETA and a R$10 store credit.

Action: Launch post-delivery NPS survey at Day 3 post-receipt. Route Detractors (score 1–6) to customer service immediately before they post a public review.

Action: Publicly respond to all negative reviews on the platform within 48 hours research shows businesses that respond to negative reviews receive a higher overall trust score.

Target: Move positive sentiment from 78.11% to 85%+ within 18 months. This would require converting approximately 6,700 negative or neutral reviews to positive achievable through delivery improvement alone (closing the 7.82% → 5% lateness gap).
